Calibration Path

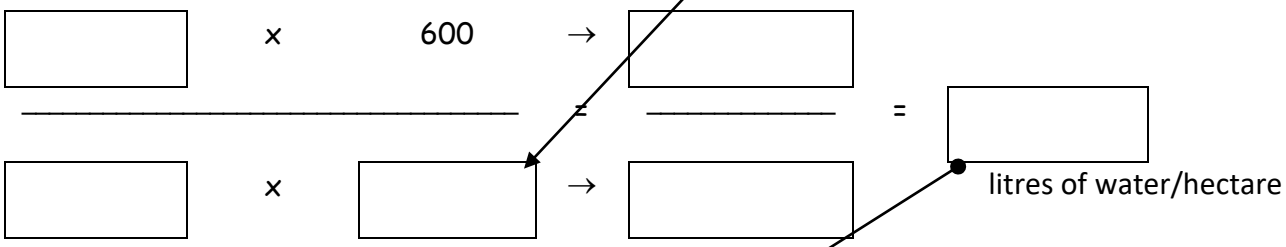

Formula A = Distance travelled (m) x 3.6 ÷ Time (seconds) = Speed (km/h)

Formula

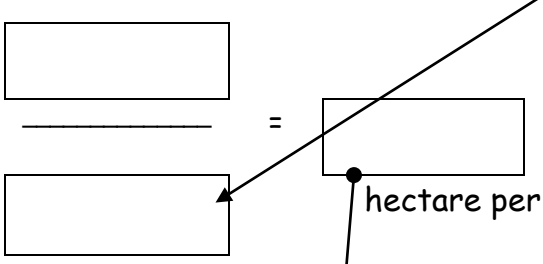

litres/hectare (ℓ/ha)

$$= \frac{\text{output of nozzle(s) (litres/minute)} \times 600}{\text{spray width (m)} \times \text{speed (km/h)}}$$

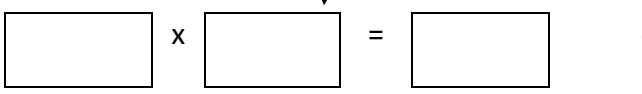

Formula D - Area Covered by one tankful

area (ha) covered by one tankful = spray tank volume (litres) litres of water per hectare

Formula E - Amount of Product Required Per Tankful

quantity of product/tank load = area covered by tank (ha) x product (agrichemical) rate/ha
